

My Summer Internship Report

Junior Web Developer – E-Governance & Digital Services, YuvaIntern

Intern Name:	Prateek Dwivedi
Organization:	YuvaIntern
Role:	Junior Web Developer – E-Governance & Digital Services
Duration:	4 Weeks (Summer 2026)
Certificate No.:	YI/2026/152773/359638
Date of Issue:	August 26, 2026

1. Introduction

I spent four weeks this summer interning with YuvaIntern as a Junior Web Developer on the E-Governance & Digital Services team. Going in, I didn't have much exposure to how government digital platforms actually get built and maintained behind the scenes, so this was a good chance to learn that firsthand — mostly by working on the content and testing side of an E-Governance portal.

2. What I Set Out to Learn

I went into the internship wanting a few specific things out of it: a real sense of how a public-facing portal is structured and kept up to date, some practical experience testing a live web platform rather than just reading about it, and a feel for how a small team actually coordinates on this kind of work day to day. I also wanted to get better at documenting what I was doing — something that's easy to skip but genuinely useful.

3. What I Actually Worked On

Most of my time went into two things: reviewing and cleaning up content on the portal, and testing it. On the content side, that meant going through pages line by line to check that information was accurate, worded clearly, and consistent with how the rest of the site was written — small things, but they add up when a portal is meant to be used by the general public.

The testing work was more hands-on. I went through forms and navigation flows to make sure they worked the way they were supposed to, checked how pages held up across different browsers and screen sizes, and kept a running log of anything that looked off — broken links, inconsistent formatting, confusing wording, that sort of thing. When I found something, I'd write it up and flag it to the team, then follow up once it was fixed to make sure it actually held. I also did some basic accessibility checks, which pushed me to think about the portal from the perspective of someone who isn't necessarily comfortable with technology.

4. Tools and Day-to-Day

Nothing too heavy on the tooling side — mostly browser developer tools to poke around at how pages were built, a shared spreadsheet to track issues I found, and regular check-ins with the team to talk through what I was seeing. Having to explain a bug clearly enough for someone else to fix it turned out to be a useful skill in itself.

5. What I Took Away From It

The biggest thing I learned is how much careful testing matters for something like an E-Governance portal — it's not glamorous work, but it's the difference between a site people can actually trust and one that quietly frustrates them. I also came away with a better sense of what "clear" writing means when you're writing for a general audience rather than for yourself, and I got more comfortable logging issues in a way that's actually useful to a development team, rather than just noting "this is broken." On a more personal level, working with a remote team for four weeks taught me a fair bit about staying organized and following up on things without needing to be reminded.

6. Closing Thoughts

Overall, this internship gave me exactly the kind of practical, close-to-the-ground experience I was hoping for. It's one thing to know that testing and content quality matter for a public platform, and another to actually spend four weeks doing that work and seeing where things go wrong in practice. I'm glad I did it, and I'm taking a fair number of habits — logging things properly, double-checking before flagging, thinking about the actual user — into whatever I work on next.
